Generated action-prefix slash commands (§ . .)

Auto-generated by `scripts/generate_agent_prefix_commands.sh` from `actions/registry.yaml`. DO NOT EDIT BY HAND — re-run the generator.

Two slash forms per action (GRAMMAR_ADDENDUM §11.4.140):

- **`<name>`** — the bare slash form 3 `/<name>`.
- **`default-<name>`** — the namespaced slash form 4 `/DEFAULT::<name>` alias (these agents disallow `::` in a command name). It maps to the IDENTICAL expansion, so `/<name>` ≡ `/default-<name>`. **Collision fallback:** if `/<name>` ever collides with a host built-in command on a given agent, invoke `/default-<name>` (the always-safe form-4 equivalent).

Per-agent install targets (the install script wires these by reference):

Agent	Source here	Install location (consuming project)
Gemini CLI	`gemini/<name>.toml`, `gemini/default-<name>.toml`	`.gemini/commands/`
Qwen Code	`qwen/<name>.toml`, `qwen/default-<name>.toml`	`.qwen/commands/`
Codex CLI	`codex/<name>.md`, `codex/default-<name>.md`	`prompts/`

Generated 9 action(s) (each as a bare + a `default-` namespaced command).
