as_bad_undeclared_read (golden-bad, AS- + AS-)

`map_undeclared.json`'s `gate_undeclared` entry carries `undeclared_reads: ["src/secret_extra.sh"]` -- a read `gate_undeclared.sh` genuinely performs (see the shared gate script) but its declaration never listed. AS-001: this marks `gate_undeclared` `INPUTS_UNSOUND`, cache-ineligible, and always-run. AS-010 additionally states "any gate is INPUTS_UNSOUND" is itself one of the unconditional determinable=false triggers -- so this fixture's change (`src/alpha.sh`, otherwise an ordinary single-component change) is STILL undeterminable overall, and the full suite runs including `gate_undeclared` itself. This is the strict, literal reading of AS-010's clause list (each condition is an independent OR-trigger, not scoped to only the currently-changed paths).
