Fixture: cs_bad_stale_cache (golden-bad)

Contract row 5 (of the fixtures table): "NEW cache returns old PASS for D's catcher | golden-bad | exit 1 (proves FR-007 errors surface here too)".

- Both configs' manifests list `[g_marker, g_noop]` (identical to `cs_bad_overeager_skip` in this respect).
- `stale_cache.json` records that NEW's run of `g_marker` for D1 is served from a CACHED verdict computed against the CLEAN (unmutated) tree (`PASS`), instead of a fresh execution against the D1-mutated copy (which the RED test independently verifies would FAIL/catch, by actually running `g_marker` against a mutated disposable copy).
- Expected: same `lost=1` /exit-1/named-D1 outcome as the two sibling golden-bad fixtures, but reached via the verdict-cache path (FR-007) rather than the affected-set (T-C03) or manifest-membership path.
