Fixture: cs_negctrl_gained_catch (negative-control, task-line-driven)

tasks.md T050's literal negative-control clause: "a run catching more PASSes". This exact wording does NOT match either of the contract's two NAMED negative-control rows (`cs_negctrl_removal_with_transfer` , `cs_negctrl_old_missed` , both about `gate_audit.py transfer-proof` / `OLD_MISSED` respectively) -- neither is about a comparison run where NEW simply catches something extra. This fixture supplies that missing case, derived directly from clause CS-004's own definition ("superset=true iff no row has `old=CAUGHT ∧ new=MISSED` "), never contradicting or extending the contract's rules -- only exercising a shape CS-004 already permits but the 8 named rows never happen to cover.

- Defect D_extra (`../_shared/patches/defect_d_extra_widget.sh`): drops `EXTRA_MARKER` .
- OLD config: `[g_marker, g_noop]` -- does not even attempt `g_extra` .
- NEW config: `[g_marker, g_noop, g_extra]` -- gains `g_extra` .
- `old_verdict=MISSED` , `new_verdict=CAUGHT` for D_extra: this is the `gained` shape, never the violating `old=CAUGHT ∧ new=MISSED` shape.
- Expected: superset holds, `counts.gained=1` , `counts.lost=0` , exit 0 -- "a run catching more PASSes".
