Fixture: cs_negctrl_old_missed (negative-control)

Contract row 8: "defect neither config catches | negative-control | `OLD_MISSED`, not counted as lost, exit 0".

- Defect D_uncaught (`../_shared/patches/defect_d_uncaught_widget.sh`): changes only a comment line; every marker (`SAFE_MARKER` , `OTHER_MARKER` , `EXTRA_MARKER`) stays present.
- Both configs list `[g_marker, g_noop]` -- neither gate's grep target is touched, so neither catches it.
- The RED test independently verifies (by executing `g_marker`) that it genuinely PASSes against the D_uncaught-mutated copy, proving the fixture is honestly uncatchable by the gate set present, not merely claimed to be.
- Expected: `OLD_MISSED=["D_uncaught"]` , `counts.lost=0` (excluded, per CS-003, from the superset test for this row), exit 0.
