Fixture: cs_real_tree_untouched (safety)

Contract row 9: "real-tree status hash equal before/after".

This is a PROCEDURAL property, not a defect/gate scenario -- there is no `config_old.json` / `config_new.json` here. It is enforced directly by the main RED test (`../../test_catchset_compare_red.sh`): a canary path inside the REAL project tree (`$FC/lib/fc_common.sh` , a file this whole fixture suite reads but never writes) is sha256-hashed before ANY fixture work begins and again after every fixture's disposable-copy work (all under `mktemp -d` , never under `$FC/tests/fixtures/`) completes; the two hashes MUST be identical.

This directly exercises CS-001 ("the harness verifies the real tree's status is byte-identical before and after (§11.4.84 quiescence)") for the RED test's OWN disposable-copy mechanism -- proving the isolation discipline the future `catchset_compare.py` implementation must also follow is genuinely followed here, not merely asserted in prose.
