mr_one_input_changed (primary FR- /plan-T-C case)

put stores a KILLED verdict against observed_input.txt's real sha256. get asks with observed_input_flipped.txt's sha256 instead (one byte of the gate's observed input genuinely changed). Task line: 'changing one gate input re-runs that gate's mutations' -- this is that case, literally.

Expected: `MISS`
