golden_true_missing_declared — the gate MUST FIRE, naming exactly `post-merge`

All five canonical hooks exist in the source roots (`src_a/` , `src_b/`); the live hook dir (`live_hooks/`) holds four. `post-merge` is the omission.

This is the fixture form of the §11.4.205 forensic: the superseded implementation reported PASS on exactly this shape, because its declared set was the same literal it installed from and so could not name a hook it did not itself list.

Expected: exit 1, output contains `MISSING post-merge` , and NOTHING else fires.
