Skill catalogue — see and activate what is not loaded

Most skills are deliberately NOT active, to keep the per-turn token cost of the available-skills list minimal. They are all still one command away, and this skill is the index that keeps them findable.

Sessions start pruned to the core set by default. If a task might be covered by a skill you cannot see in your available-skills list, it has almost certainly not been removed — it is inactive. Look here before improvising from memory.

See everything that exists

```
constitution/scripts/skill_activation/skill_activate.sh list
```

`[*]` = active now · `[ ]` = available, not loaded.

Activate one, then use it

```
constitution/scripts/skill_activation/skill_activate.sh activate <name>
```

Activation takes effect in THIS running session — the skill appears in your available-skills list within the same session, no restart. If activation fails, the command says so explicitly and exits non-zero: treat that as "the skill is NOT available" and say so, never assume it loaded.

Release it when done

```
constitution/scripts/skill_activation/skill_activate.sh deactivate <name>
```

This unlinks it so the NEXT session does not pay for it. It does not shrink the current session (the platform caches an already-loaded skill).

Nothing here has been deleted

`session-init` prunes the active set to the declared core by default. Pruning NEVER deletes: a symlink loses only its link (the target is untouched), and a real skill directory is MOVED to `.claude/.skill-activation/pool/`, which is itself a searched source. So every pruned skill is still listed above and comes straight back with `activate <name>` — dormant and one command away, never removed. If you need one, activate it; do not tell the user a capability is gone.

Obligation

`superpowers:using-superpowers` still binds: if any skill could apply — even at 1% relevance — find it here and invoke it rather than improvising. A skill being inactive is never a reason to skip it.
